

Project Design Phase-II
Data Flow Diagram & User Stories

Date	01 October 2026
Team ID	SWTID-2026-4498
Project Name	Import data using Transform Maps
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

Level 0 – Data Flow Diagram: Import data using Transform Maps (ServiceNow)

User Stories

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
ServiceNow Administrator	Data Source Setup	USN-1	As an administrator, I can create a data source and attach an Excel/CSV file so that the data can be loaded into ServiceNow.	The data source is saved and the file is attached successfully.	High	Sprint-1

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
		USN-2	As an administrator, I can load the file into an Import Set (staging) table so that I can review the raw data before it is transformed.	All rows of the file appear in the import set table.	High	Sprint-1
	Transform Map Creation	USN-3	As an administrator, I can create a Transform Map between the import set table and the target table.	The Transform Map is created with the correct source and target tables.	High	Sprint-1
		USN-4	As an administrator, I can map source fields to target table fields (auto map matching fields and map the rest manually).	Every required source field is mapped to a target field.	High	Sprint-2
		USN-5	As an administrator, I can set a coalesce field so that existing records are updated instead of duplicated.	Re-running the import updates existing records and creates no duplicates.	Medium	Sprint-2
		USN-6	As an administrator, I can add a transform script or field-level script to clean or convert values during import.	Values are converted as expected in the target table.	Low	Sprint-3
	Run & Validate Import	USN-7	As an administrator, I can run the transform so that the staged data is loaded into the target table.	Records are inserted or updated in the target table.	High	Sprint-2
		USN-8	As an administrator, I can view the transform history and error log to find and fix failed rows.	Inserted, updated, ignored and error counts are visible for each run.	Medium	Sprint-3
Source Data Owner	Data Preparation	USN-9	As a data owner, I can provide the data in a clean Excel/CSV file with column names that match the agreed format.	The file loads without header or format errors.	High	Sprint-1
ServiceNow User (Business User / Fulfiller)	Data Verification	USN-10	As a user, I can open the target table and see the imported records so that I can use the data in my daily work.	Imported records are visible, complete and accurate.	High	Sprint-3
